

VARIABLE CONTRIBUTION TRENDS. The plot shows how the relative contribution (%) contribution) of each top environmental predictor to the ensemble models changes across temporal bins over the study period. Each line is a Bayesian regression fit to one variable's contribution trajectory; the legend indicates the direction of that trend where statistically supported (+ increasing, – decreasing). The table reports, for each variable, the number of temporal bins in which it appeared among the top predictors (Points), the Bayesian regression slope, 95% credible interval bounds (CI Low, CI High), probability of direction (PD), and percentage of the posterior within the region of practical equivalence (ROPE %). Variables in bold show strong directional trends.
